

COUNTRY INDICATORS AND SDGS

GDP per capita — 8.1.1 Real GDP growth rate

7.3.1 Energy intensity

7.1.1 Access to electricity (% population)  
7.1.2 Access to clean cooking (% population)  
7.2.1 Renewable energy (% TREC)

7.a.1 Public flows to renewables

7.b.1 Per capita renewable capacity

11.6.2 Air particulate matter (PM<sub>2.5</sub>)

TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2017	2022
Non-renewable (TJ)	647 696	604 741
Renewable (TJ)	66 616	90 201
Total (TJ)	714 312	694 942
Renewable share (%)	9	13

Growth in TES	2017-22	2021-22
Non-renewable (%)	-6.6	-6.7
Renewable (%)	+35.4	-2.7
Total (%)	-2.7	-6.2

Primary energy trade	2017	2022
Imports (TJ)	688 146	684 483
Exports (TJ)	222 180	201 319
Net trade (TJ)	- 465 966	- 483 164
Imports (% of supply)	96	98
Exports (% of production)	85	71
Energy self-sufficiency (%)	37	41

Total energy supply in 2022

Renewable energy supply in 2022

# RENEWABLE ENERGY CONSUMPTION (TFEC)

### Renewable TFEC trend

Consumption by sector	2017	2022
Industry (TJ)	25 587	24 990
Transport (TJ)	6 562	7 725
Households (TJ)	8 894	34 823
Other (TJ)	50 998	47 938

### Renewable energy consumption in 2022

# ELECTRICITY CAPACITY

### Installed capacity trend

### Renewable capacity in 2024

### Net capacity change (GW)

### Net capacity change in 2024 (MW)

Non-renewable	- 490	Hydro and marine	0
Solar	+ 274	Wind	0
Bioenergy	0	Geothermal	0

### Capacity utilisation in 2023 (%)

## ELECTRICITY GENERATION

Generation in 2023	GWh	%
<b>Non-renewable</b>	<b>23 194</b>	<b>78</b>
<b>Renewable</b>	<b>6 709</b>	<b>22</b>
Hydro and marine	4 686	16
Solar	605	2
Wind	4	0
Bioenergy	1 414	5
Geothermal	0	0
<b>Total</b>	<b>29 903</b>	<b>100</b>

Per capita electricity generation (kWh)

Electricity generation trend

## LATEST POLICIES, PROGRAMMES AND LEGISLATION

- 1 Improving the energy and efficiency of public buildings ("Fast Actions") 2024
- 2 Modernisation and digitalisation of the transmission system and regional distribution systems 2024
- 3 Regulation 2024/573 on fluorinated greenhouse gases 2024
- 4 Slovak Republic - REPowerEU 2024
- 5 Compensation for electricity and gas providers of small off-takers 2023

## ENERGY AND EMISSIONS

CO<sub>2</sub> emissions by sector

Elec. & heat generation CO<sub>2</sub> emissions in

Avoided emissions from renewable elec. & heat

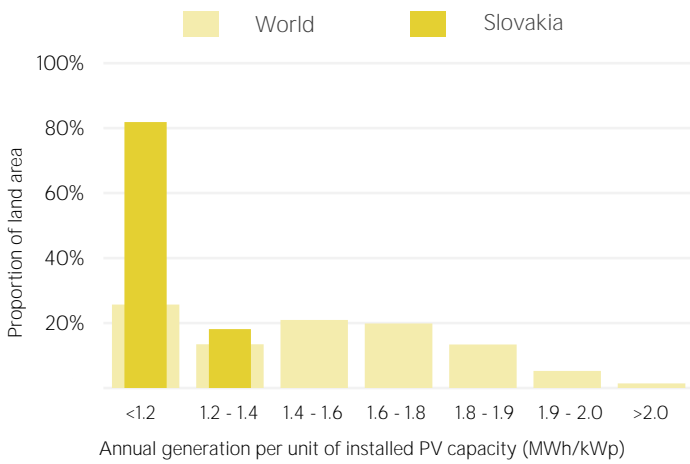

Avoided emissions based on fossil fuel mix used for power

CO<sub>2</sub> emission factor for elec. & heat generation

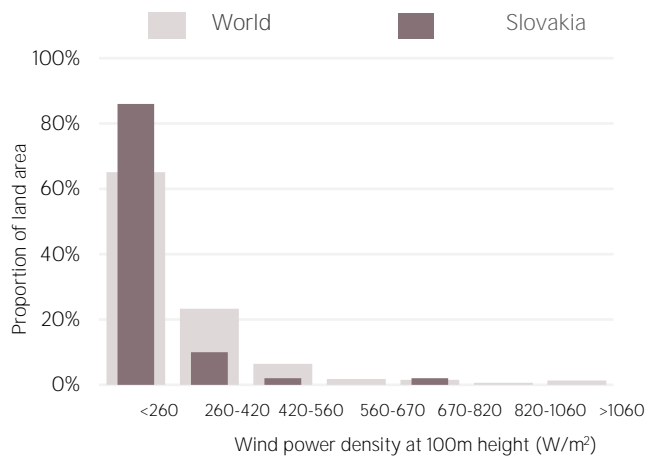

Calculated by dividing power sector emissions by elec. + heat gen.

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

**Solar PV:** Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

**Onshore wind:** Potential wind power density (W/m<sup>2</sup>) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

**Biomass:** Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

**Sources:** IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO: World Bank: IEA: IRENA: and UNSD): UN World Population Prospects: UNSD Energy Balances: UN COMTRADE: World Bank World Development Indicators: EDGAR: REN21 Global Status Report: IEA-IRENA Joint Policies and Measures Database: IRENA Global Atlas: and World Bank Global Solar Atlas and Global Wind Atlas.

**Additional notes:** Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to [statistics@irena.org](mailto:statistics@irena.org).
