

COUNTRY INDICATORS AND SDGS

8.1.1 Real GDP growth rate

7.3.1 Energy intensity

7.1.1 Access to electricity (% population)
7.1.2 Access to clean cooking (% population)
7.2.1 Renewable energy (% TFC)

7.a.1 Public flows to renewables

7.b.1 Per capita renewable capacity

11.6.2 Air particulate matter (PM_{2.5})

TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2017	2022
Non-renewable (TJ)	775	815
Renewable (TJ)	4	19
Total (TJ)	779	834
Renewable share (%)	1	2

Growth in TES	2017-22	2021-22
Non-renewable (%)	+5.2	+4.5
Renewable (%)	+336.0	0.0
Total (%)	+7.0	+4.4

Primary energy trade	2017	2022
Imports (TJ)	1109	1123
Exports (TJ)	0	0
Net trade (TJ)	-1109	-1123
Imports (% of supply)	142	135
Exports (% of production)	0	0
Energy self-sufficiency (%)	1	2

Total energy supply in 2022

Renewable energy supply in 2022

RENEWABLE ENERGY CONSUMPTION (TFEC)

Renewable TFEC trend

Renewable energy consumption in 2022

Consumption by sector	2017	2022
Industry (TJ)	0	1
Transport (TJ)	0	0
Households (TJ)	2	10
Other (TJ)	6	19

ELECTRICITY CAPACITY

Installed capacity trend

Renewable capacity in 2024

Net capacity change in 2024 (MW)

Net capacity change in 2024 (MW)

Non-renewable	0	Hydro and marine	0
Solar	0	Wind	0
Bioenergy	0	Geothermal	0

Capacity utilisation in 2023 (%)

ELECTRICITY GENERATION

Generation in 2023	GWh	%
Non-renewable	54	91
Renewable	5	9
Hydro and marine	0	0
Solar	5	9
Wind	0	0
Bioenergy	0	0
Geothermal	0	0
Total	59	100

Per capita electricity generation (kWh)

ENERGY AND EMISSIONS

CO₂ emissions by sector

Avoided emissions from renewable elec. & heat

Avoided emissions based on fossil fuel mix used for power

Elec. & heat generation CO₂ emissions in

CO₂ emission factor for elec. & heat generation

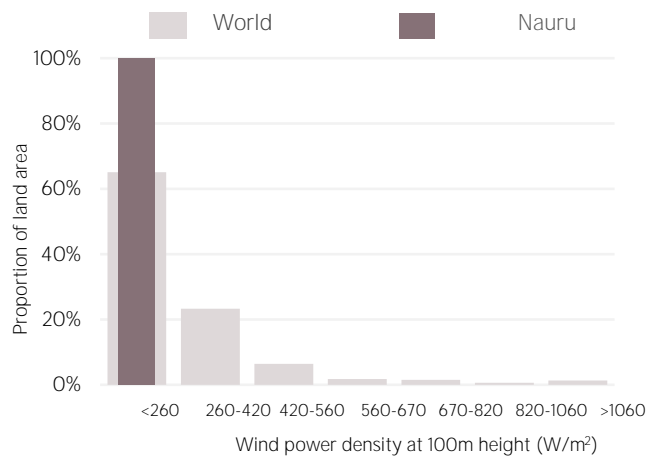

Calculated by dividing power sector emissions by elec. + heat gen.

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m^2) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Biomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

Sources: IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO: World Bank: IEA: IRENA: and UNSD): UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
