

# Bolivia (Plurinational State of)

## COUNTRY INDICATORS AND SDGS

## TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2017	2022
Non-renewable (TJ)	350 031	341 183
Renewable (TJ)	35 890	59 498
Total (TJ)	385 921	400 681
Renewable share (%)	9	15

Growth in TES	2017-22	2021-22
Non-renewable (%)	-2.5	+7.5
Renewable (%)	+65.8	-0.7
Total (%)	+3.8	+6.2

Primary energy trade	2017	2022
Imports (TJ)	52 462	98 716
Exports (TJ)	553 616	371 349
Net trade (TJ)	501 154	272 633
Imports (% of supply)	14	25
Exports (% of production)	63	55
Energy self-sufficiency (%)	227	169

### Total energy supply in 2022

### Renewable energy supply in 2022

# RENEWABLE ENERGY CONSUMPTION (TFEC)

### Renewable TFEC trend

Consumption by sector	2017	2022
Industry (TJ)	12 023	27 967
Transport (TJ)	0	2 828
Households (TJ)	6 661	8 267
Other (TJ)	26 091	35 425

### Renewable energy consumption in 2022

# ELECTRICITY CAPACITY

### Installed capacity trend

### Renewable capacity in 2024

### Net capacity change (GW)

### Net capacity change in 2024 (MW)

Non-renewable	0	Hydro and marine	- 19
Solar	+ 4	Wind	0
Bioenergy	0	Geothermal	0

### Capacity utilisation in 2023 (%)

## ELECTRICITY GENERATION

Generation in 2023	GWh	%
<b>Non-renewable</b>	<b>8 386</b>	<b>69</b>
<b>Renewable</b>	<b>3 697</b>	<b>31</b>
Hydro and marine	2 323	19
Solar	370	3
Wind	483	4
Bioenergy	522	4
Geothermal	0	0
<b>Total</b>	<b>12 084</b>	<b>100</b>

### Per capita electricity generation (kWh)

### Electricity generation trend

## LATEST POLICIES, PROGRAMMES AND LEGISLATION

- 1 Bolivia Law No. 1546 2024
- 2 Import duty and tax reductions for electric and hybrid vehicles 2021
- 3 Second NDC of Plurinational State of Bolivia 2021
- 4 Law No 928: Law of the National Strategic Public Company for Bolivian Lithium Deposits- YLB 2017
- 5 Patriotic Agenda of the Bi-century 2015-2025 2015

## ENERGY AND EMISSIONS

### CO<sub>2</sub> emissions by sector

### Avoided emissions from renewable elec. & heat

Avoided emissions based on fossil fuel mix used for power

### Elec. & heat generation CO<sub>2</sub> emissions in

### CO<sub>2</sub> emission factor for elec. & heat generation

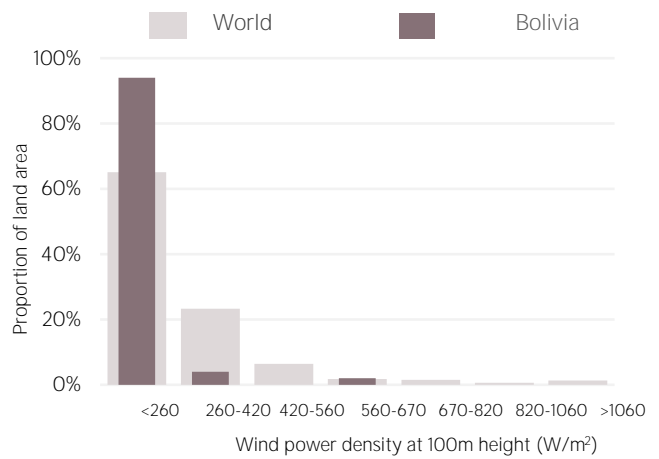

Calculated by dividing power sector emissions by elec. + heat gen.

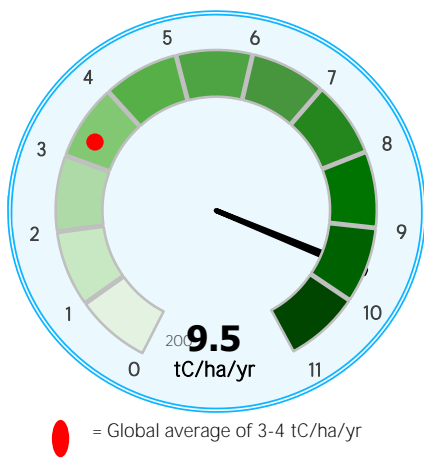

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

**Solar PV:** Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

**Onshore wind:** Potential wind power density (W/m<sup>2</sup>) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

**Biomass:** Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

**Sources:** IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO: World Bank: IEA: IRENA: and UNSD): UN World Population Prospects: UNSD Energy Balances: UN COMTRADE: World Bank World Development Indicators: EDGAR: REN21 Global Status Report: IEA-IRENA Joint Policies and Measures Database: IRENA Global Atlas: and World Bank Global Solar Atlas and Global Wind Atlas.

**Additional notes:** Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to [statistics@irena.org](mailto:statistics@irena.org).
